Brushless DC Motor and Driver Package
BLF Series

● Additional Information ●
 Technical reference → Page F-1
 Safety standards → Page G-2

The **BLF** Series brushless DC motor achieved a maximum motor speed of 4000 r/min. With the digital operator, digital setting and display are possible, offering wide-ranging functions to meet your diverse needs.

Motor: **UL** **UL** **US** **CE** Driver: **UL** **LISTED** **CE**
 ● List of safety standard approved products (Model, Standards, File No., Certification Body)
 → Page G-10

Features

● **Wide Speed Control Range from 80 r/min up to 4000 r/min**

A wide speed control range from 80 to 4000 r/min (speed ratio of 1:50) enables the motor to be used for various applications.

● **Energy-Saving**

At an output power of 60 W, the power loss of the **BLF** Series is approximately half that of an inverter-controlled AC motor, which contributes to the energy-saving operation of your equipment.

● **Multi-Speed Operation Using up to Eight Speeds**

Up to eight speeds can be set by digital setting. On the digital operator, the speed can be set in units of 1 r/min and a different acceleration/deceleration time can be set for each speed. Switch the speed according to your needs.

● **Easy Operation with the Digital Operator**

You can perform various settings and operations using the six operation keys on the digital operator.

● **Various Digital Displays**

Speed, load factor, alarm code, etc. can be displayed digitally.

● The speed can be displayed as gearhead output shaft speed.

● **Four Speed Setting Methods**

Select one of four speed setting methods according to the condition in which your equipment is used.

● **Speed Teaching Function**

The speed adjusted by physically operating the motor can be set and stored.

● **Sink/Source Logic Switchable**

To ensure safety and usability, sink/source logic can be selected by a switch.

● The factory setting is the source logic.

● **Full Range of Protective Functions**

The **BLF** Series detects various motor and driver errors such as overload, overvoltage, undervoltage, missing phase, overspeed, overcurrent, EEPROM error, CPU error, operation error and external error. Upon detection of an error, the driver will immediately stop the motor and output an alarm signal.

● **Detachable Digital Operator**

The digital operator can be detached from the driver and used at a location as far as 5 m away using an accessory remote-control kit. Use the digital operator as a handy operation unit or display outside the switch board. (The digital operator conforms to IP65 when the remote-control kit is used.)

● **A Maximum Motor/Driver Wiring Distance of 20 m**

By separating the motor cable and signal cable, the **BLF** Series is less vulnerable to noise and capable of an extension of the motor/driver wiring distance to a maximum of 20 m.

Select connection cables (sold separately) from among the eight lengths of 1 m to 20 m.

Note:

● Be sure to purchase connection cables (sold separately).

● **Uses a Terminal Block for Driver Connection**

The driver-end of each cable has terminals, instead of a connector, to make it easy to wire the cable into a switch board.

● **Long Life Gearhead Rating of 10000 Hours**

The rated life of the parallel shaft gearhead and hollow shaft flat gearhead is 10000 hours (at 3000 r/min). The parallel shaft gearhead achieves a rated life of twice as long as that of a conventional gearhead.

● The 120 W parallel shaft gearhead has a tapped hole at the shaft tip.

● **Features of Hollow Shaft Flat Gearhead**

◇ **Space-Saving and Low-Cost**

The output shaft can be coupled directly to your drive shaft without using a coupling. The flexible installation modes, such as installation on either the front or rear face or by using the center shaft, allow you to reduce the size and installation space of your equipment. Since no shaft-coupling parts are needed, the parts cost and labor will also decrease.

◇ **High Permissible Torque**

While the permissible torque of parallel shaft gearhead saturates at high gear ratios, the hollow shaft flat gearhead enables the motor torque to be fully utilized.

● **IP65 Protection**

The motor (excluding the mounting surface of the round shaft type and the connector) and digital operator (when an accessory remote-control kit is used.) provide a high level of protection conforming to IP65. It means you can use the **BLF** Series in locations where the unit may come into contact with water.

● The **BLF** Series is not designed for washing directly in water or use in an environment where the unit constantly receives water splashes. The protection class of the driver is IP20.

● **RoHS** RoHS-Compliant

The **BLF** Series conforms to the RoHS Directive that prohibits the use of six chemical substances including lead and cadmium.

● Details of RoHS Directive → Page G-23

System Configuration

Combination Type – Parallel Shaft Gearhead/Round Shaft Type

No.	Product Name	Overview	Page
①	Connection Cables	Dedicated cable for connecting the motor and driver (1 to 20 m). Be sure to purchase this cable.	B-33
②	Remote-Control Kit	Use this kit when removing the digital operator from the driver to operate it remotely.	B-33
③	Mounting Brackets	Dedicated mounting bracket for the motor and gearhead.	A-230
④	Flexible Couplings	Clamp type coupling that connects the motor or gearhead shaft to the driven shaft.	A-233
⑤	External Speed Potentiometer	Used to set and adjust the speed of the speed control motor (PAVR-20KZ).	A-237

● The values for each specification apply to the motor only.

● In addition to the products shown above, the products for single-phase 100-120 VAC and three-phase 200-240 VAC are also available. Please contact the nearest Oriental Motor sales office.

Common Specifications

Item	Specifications
Speed Setting Method	Select one of the following methods: • Set using the internal speed potentiometer • Set using the digital operator: Up to eight speeds • Set using an accessory external speed potentiometer: PAVR-20KZ (20 kΩ, 1/4 W) (sold separately) • Set using external DC voltage: 0~5 VDC or 0~10 VDC
Acceleration/Deceleration Time (At 3000 r/min)	0.2~15 sec. (factory setting: 0.5 sec.) Up to eight speeds using the digital operator
Input Signal (In the remote mode)	Photocoupler input mode Input resistance 3.3 kΩ Internal power supply voltage: 14 VDC±10% Connectable external voltage: 24 VDC±10% (only for source logic) Source input (factory setting), Sink input/2-wire input mode (factory setting), or 3-wire input mode CW (START/STOP) input, CCW (RUN/BRAKE) input, STOP-MODE (CW/CCW) input, Speed data select, Alarm reset input, External error input Names in () apply in the 3-wire input mode.
Output Signal	Open-collector output 4.5~26.4 VDC, 10 mA max. (5~10 mA for Speed output) Speed output (30 pulses/rotation), Alarm output1, Alarm output2
Protective Function*	When the following are activated, the "Alarm" signal will be output and the motor will coast to a stop. (The motor will stop instantaneously in the event of an external error.) • Overload Protection: Activated when the motor load exceeds rated torque for a minimum of 5 seconds. • Overvoltage Protection: Activated when the voltage applied to the driver exceeds 120 VAC or 240 VAC by a minimum of 20%, a gravitational operation is performed or a load exceeding the permissible load inertia is driven. • Undervoltage Protection: Activated when the voltage applied to the driver falls below 100 VAC or 200 VAC by a minimum of 40%. • Missing Phase Protection: Activated when an error is detected in the signals received from the motor due to poor connection or breakage of the signal cable, etc. • Overspeed Protection: Activated when the speed of the motor shaft exceeds 4800 r/min. • Overcurrent Protection: Activated when an excessive current flows through the driver due to a ground fault, etc. • CPU Error, EEPROM Error, External Error, Operation Error
Maximum Extension Distance	Motor/Driver Distance: 20.4 m (when a dedicated connection cable is used)
Time Rating	Continuous

* With the **BLF** Series, the motor speed cannot be controlled in a gravitational operation or other application where the motor shaft is turned by the load.

When a load exceeding the permissible load inertia is driven or a gravitational operation is performed, the overvoltage protective function will be activated and the motor will coast to a stop.

General Specifications

Item	Motor	Driver
Insulation Resistance	100 MΩ or more when 500 VDC megger is applied between the windings and the case after continuous operation under normal ambient temperature and humidity.	100 MΩ or more when 500 VDC megger is applied between the power supply input terminal and the protective earth terminal, and between the power supply input terminal and the I/O terminal after continuous operation under normal ambient temperature and humidity.
Dielectric Strength	Sufficient to withstand 1.5 kV at 50 Hz applied between the windings and the case for 1 minute after continuous operation under normal ambient temperature and humidity.	Sufficient to withstand 1.8 kV at 50 Hz applied between the power supply input terminal and the protective earth terminal for 1 minute, and 3 kV at 50 Hz applied between the power supply input terminal and the I/O terminal for 1 minute after continuous operation under normal ambient temperature and humidity.
Temperature Rise	Temperature rise of the windings and the case are 50°C or less, and 40°C or less*1 respectively measured by the thermocouple method after continuous operation under normal ambient temperature and humidity.	Temperature rise of heat sink are 50°C or less measured by the thermocouple method after continuous operation under normal ambient temperature and humidity.
Operating Environment	Ambient Temperature	0~+50°C (non-freezing)
	Ambient Humidity	85% or less (non-condensing)
	Altitude	Up to 1000 m above sea level
	Atmosphere	No corrosive gases or dust. Cannot be used in a radioactive area, magnetic field, vacuum or other special environment
Vibration	Not subject to continuous vibration or excessive impact In conformance with JIS C 60068-2-6, "Sine-Wave Vibration Test Method" Frequency range: 10~55 Hz Pulsating amplitude: 0.15 mm Sweep direction: 3 directions (X, Y, Z) Number of sweeps: 20 times	
Storage Condition*2	Ambient Temperature	-25~+70°C (non-freezing)
	Ambient Humidity	85% or less (non-condensing)
	Altitude	Up to 3000 m above sea level
Insulation Class	UL, CSA: class A (105°C) EN: class E (120°C)	—
Degree of Protection	IP65 (Excluding the mounting surface of the round shaft type and connectors)	IP20

*1 For round shaft types, please attach to the heat radiation plate (material: aluminum) of the following sizes to maintain a maximum motor case temperature of 90°C.

BLF230C-A: 115×115 mm, 5 mm thick

BLF460C-A: 135×135 mm, 5 mm thick

BLF5120C-A: 165×165 mm, 5 mm thick

BLF6200C-A: 200×200 mm, 5 mm thick

*2 The storage condition applies to a short period such as a period during transportation.

Note:

- Do not measure insulation resistance or perform the dielectric strength test while the motor and driver are connected.

■ Connection and Operation

● Names and Functions of Driver Parts

◇ Digital Operator

● I/O Signal

Terminal Name	Signal	Signal Name	Function and Operation
TH	Input	N. C.	Do not connect any signal to this terminal.
TH		N. C.	Do not connect any signal to this terminal.
M0		M0 Input	These signals are used to select operation data in multi-speed operation. One of up to eight preset speed data can be selected using the M0, M1 and M2 inputs.
M1		M1 Input	
M2		M2 Input	
VH		VH Input	These signals are used to set speeds via an external speed potentiometer or external DC voltage.
VM		VM Input	
VL		VL Input	
C3		IN-COM1	Input signal common (0 V)
X0*1		EXT-ERROR Input	External error input (Normal close)
C0		IN-COM0	Input signal common
C1		IN-COM0	Input signal common
X1*2		2-Wire Mode: CW Input	Clockwise direction/stop switch input signal
		3-Wire Mode: START/STOP Input	Start/stop input signal
X2*2		2-Wire Mode: CCW Input	Counterclockwise direction/stop switch input signal
		3-Wire Mode: RUN/BRAKE Input	Run/instantaneous stop input signal
X3*2		2-Wire Mode: STOP-MODE Input	This signal is input to select the motor stop action.
		3-Wire Mode: CW/CCW Input	Clockwise/counterclockwise direction input signal
X4	N. C.	Do not connect any signal to this terminal.	
X5	ALARM-RESET Input	This signal is used to reset alarms.	
Y1	Output	ALARM-OUT1 Output	This signal is output upon generation of an alarm. (Normal close)
Y2		ALARM-OUT2 Output	This signal is output upon actuation of the overload protective function or overload warning function. (Normal close)
Y0		SPEED-OUT Output	30 pulses are output per each rotation of the motor output shaft.
C2		OUT-COM	Output signal common

*1 Do not remove the short circuit bar if the EXT-ERROR input is not used.

*2 The functions of the external-input signal terminals X1, X2 and X3 can be changed between the 2-wire input mode and 3-wire input mode. The functions under the 2-wire input mode are initially assigned to the terminals.

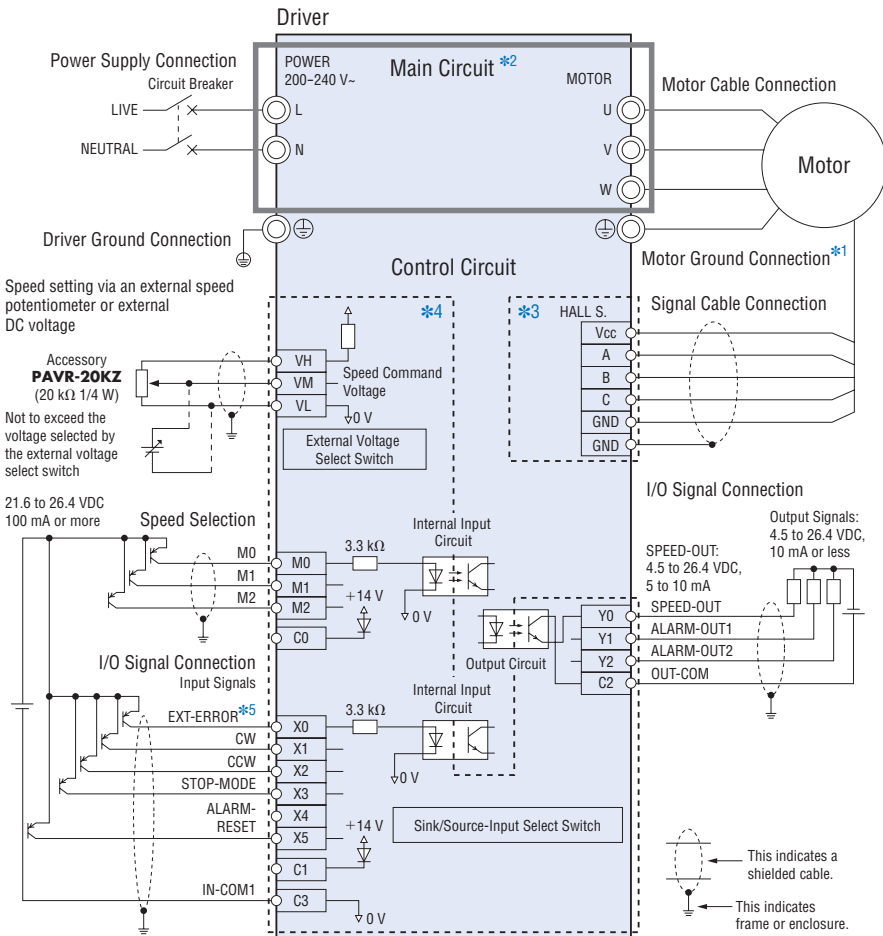

● Digital Operator Indicator

Display	Function	Details
RUN	Running	A green lamp stays lit while the motor is running.
ALARM	Alarm	A red lamp turns on when an alarm occurs.
Mode	MNTR	Monitor mode The motor can be operated in this mode. The motor speed and load condition are displayed during motor operation.
	F/R	Direction setting mode If the digital operator is used to operate the motor, set the motor direction in this mode. For: Clockwise direction, rEv: Counterclockwise direction
	LO/RE	Digital operator/external-input signal mode In this mode, set whether to use the digital operator or external I/O signals to input the motor operation/stop signals. Lo: Digital operator, rE: External-input signals
	PRGM	Data setting mode In this mode, set the data needed to operate the motor. Operation data (eight speeds and acceleration/deceleration times) Gear ratio setting/conveyor speed setting Input mode Overload warning function
Display Unit	r/min	Motor speed The speed of the motor or gearhead output shaft is displayed.
	m/min	Conveyor speed An equivalent moving speed of the work on a conveyor or other transfer system is displayed.
	%	Load factor* The actual load is displayed as a percentage of the rated torque being 100%.

*A maximum error of approximately 20% may generate when the motor is operated at the rated speed under the rated load.

● Connection Diagrams

The figure below is a connection diagram for a configuration based on a single-phase 200-240 VAC supply voltage, with the sink/source-input select switch set to the source side.

- *1 The grounding method will vary depending on the length of the connection cable. When the connection cable is 7 m or shorter: Connect the protective earth terminal on the connection cable to the protective earth terminal on the driver. When the connection cable is 10 m or longer: Connect the protective earth terminal of the motor directly to the grounding point.
- *2 The main circuit is insulated to prevent electrical shock resulting from accidental contact by a hand, etc.
- *3 The signal cable connection terminals and the signal cable including the shielded cable comprise an ELV circuit, which is insulated from dangerous voltages only by means of basic insulation. Therefore, connect the shielded cable to the GND point specified in the connection diagram, instead of connecting it to a protective earth terminal.
- *4 The I/O signal connection terminals comprise a SELV circuit, which is insulated from dangerous voltages by means of double insulation or reinforced insulation.
- *5 X0 is an external error input. When this signal turns OFF, an alarm will be output.

◇ Applicable Crimp Terminals

- Power Supply Connection Terminal (M3.5): Round Terminal with Insulation

- Protective Earth Terminal (M4): Round Terminal with Insulation

• I/O Terminals

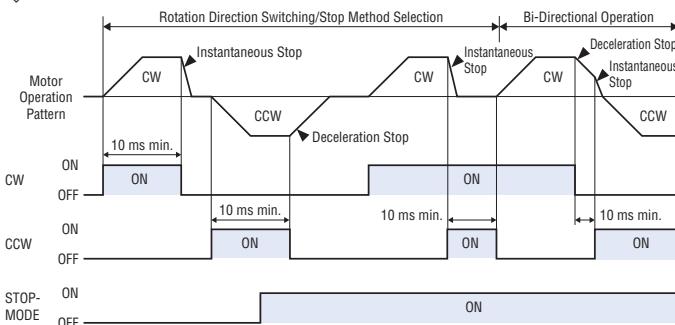

Use the terminals specified below for connection using crimp terminals. Please note that the applicable crimp terminal will vary depending on the size of the wire. The following terminals can be used with wires of AWG26 to 22.

- [Manufacturer: Phoenix Contact]
- AI 0.25-6 Applicable cable size : AWG26 to 24 (0.14 to 0.2 mm²)
- AI 0.34-6 Applicable cable size : AWG22 (0.3 mm²)

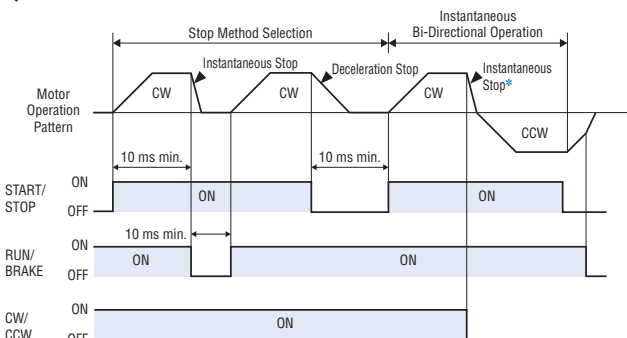

● Timing Chart

◇ 2-Wire Mode

- The CW input signal, CCW input signal and STOP-MODE signal can be used to control all motor operations, such as run, stop, direction switching, deceleration stop and instantaneous stop.
- Switching the CW signal ON will cause the motor to turn clockwise as viewed from the motor shaft, while switching the CCW signal ON will cause the motor to turn counterclockwise. Switching each signal OFF will stop the motor. If both the CW signal and CCW signal are turned ON at the same time, the motor will stop instantaneously. The motor will start at the rise time corresponding to the acceleration time (ACC) set on the digital operator.
- Switching the STOP-MODE signal ON will cause the motor to decelerate at the deceleration time (DEC) set on the digital operator until it eventually stops. Switching the STOP-MODE signal OFF will cause the motor to stop instantaneously.

◇ 3-Wire Mode

- The START/STOP signal, RUN/BRAKE signal and CW/CCW signal can be used to control all motor operations, such as run/stop, instantaneous stop and direction switching.
- Switching both the START/STOP signal and RUN/BRAKE signal ON at the same time will start the motor. At this time, switching the CW/CCW signal ON will cause the motor to turn clockwise as viewed from the motor shaft, while switching the signal OFF will cause the motor to turn counterclockwise. The motor will start at the rise time corresponding to the acceleration time (ACC) set on the digital operator.
- Switching the RUN/BRAKE signal OFF while the START/STOP signal is ON will cause the motor to stop instantaneously. Switching the START/STOP signal OFF while the RUN/BRAKE signal is ON will cause the motor to decelerate at the deceleration time (DEC) set on the digital operator until it eventually stops.

* Changing the direction while the motor is running will cause the motor to stop instantaneously and then change its direction.

● I/O Signal Circuits

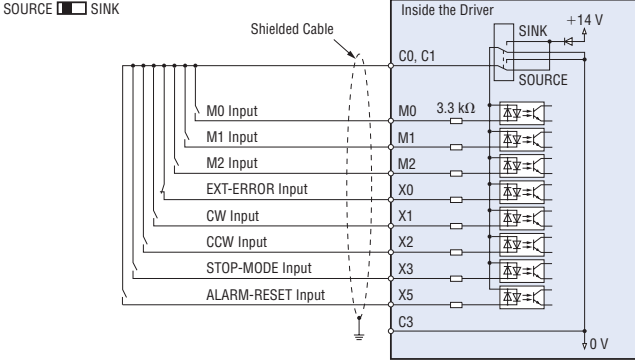

The initial setting is the source logic. Select the sink logic or source logic according to the controller you will be using.

◇ Input Circuit

Common to the CW (START/STOP), CCW (RUN/BRAKE), STOP-MODE (CW/CCW), EXT-ERROR, ALARM-RESET and operation-data selection inputs.

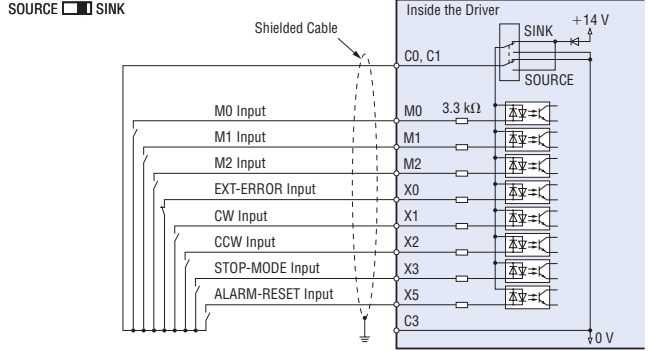

● Source Logic

Controlled by Relays or Switches

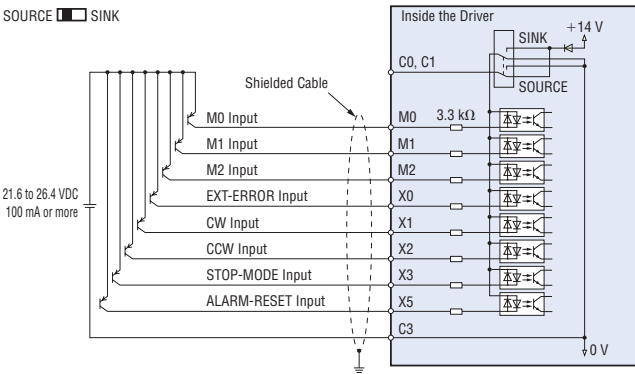

● Sink Logic

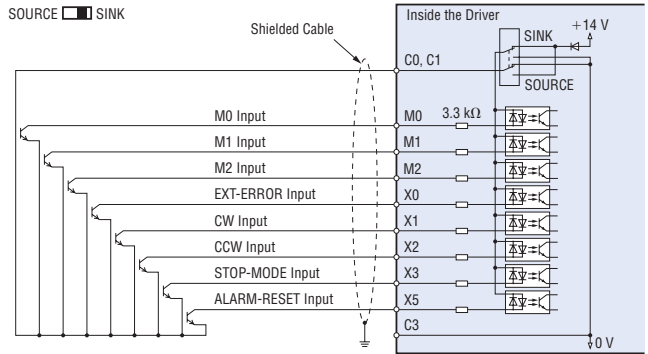

Controlled by Relays or Switches

Controlled by Transistor

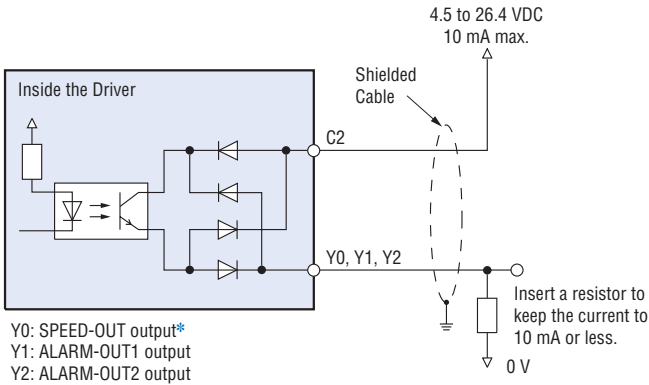

Controlled by Transistor

◇ Output Circuit

Common to the SPEED-OUT, ALARM-OUT1 and ALARM-OUT2 outputs.

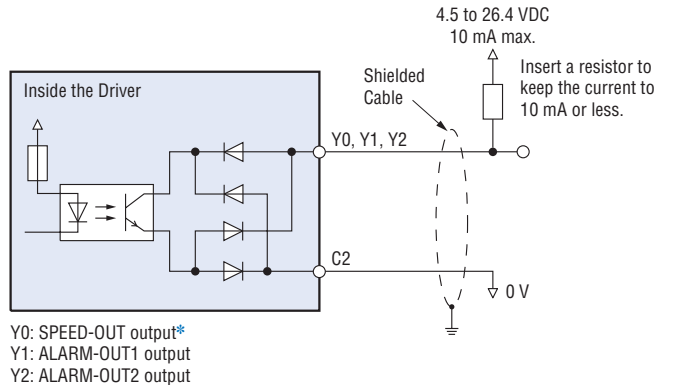

● Source Logic

Y0: SPEED-OUT output*
Y1: ALARM-OUT1 output
Y2: ALARM-OUT2 output

*Supply a current of 5 mA or more to the SPEED-OUT output.

● Sink Logic

Y0: SPEED-OUT output*
Y1: ALARM-OUT1 output
Y2: ALARM-OUT2 output

*Supply a current of 5 mA or more to the SPEED-OUT output.

◇ When an External Control Device with a Built-In Clamp Diode is Used

When you want to use the external control device with a built-in clamp diode, if the external control device power is turned off with the driver power turned on, current will be applied and the motor may run. When the power is turned on or off simultaneously, the motor may run temporarily due to differences in power capacity. The external control device power must be turned on first, and driver power must be turned off first.

● Example of Sink Logic

◇ SPEED-OUT Output

Pulse signals of 30 pulses (pulse width: 0.2 ms) are output per each rotation of the motor output shaft in synchronization with the motor operation.

By measuring the frequency of SPEED-OUT outputs, the motor speed can be calculated.

$$\text{SPEED-OUT output frequency (Hz)} = \frac{1}{T}$$

$$\text{Motor shaft speed (r/min)} = \frac{\text{SPEED-OUT output frequency}}{30} \times 60$$

◇ ALARM-OUT1 Output

When any of the driver's protective functions is activated, the ALARM-OUT1 output will turn OFF and the digital operator will display an alarm code. The motor will coast to a stop.

◇ ALARM-OUT2 Output

The ALARM-OUT2 output will turn OFF when the driver's overload protective function or overload warning function is activated. Actuation of any other protective function will not turn this output OFF.

The overload warning function is activated based on a preset load factor relative to the rated torque. The ALARM-OUT2 output will turn OFF once the set load factor is exceeded.

(A desired load factor can be set at 10% intervals between 50 and 100%.)

Type of Protective Function	ALARM-OUT1 Output	ALARM-OUT2 Output
Normal Operation	ON	ON
Overload Protective Function	OFF	OFF
Other Protective Function	OFF	ON
Overload Warning Function*	ON	OFF

* A maximum error of approximately 20% may generate when the motor is operated at the rated speed under the rated load.

● Operating Methods

One of the following two operating methods (a and b) can be set by switching between the digital-operator mode and external-input signal mode.

- a) Operate the motor using the RUN and STOP keys on the digital operator
- b) Operate the motor using external-input signals

● Speed Setting Methods

One of the following four methods (① to ④) can be used to set speeds:

- ① Set speeds using the internal speed potentiometer
Set speeds using the potentiometer provided on the driver's front panel.
- ② Set speeds using the digital operator
The digital operator can be used to set speeds in units of 1 r/min. Up to eight speed data can be set.
- ③ Set speeds using an external speed potentiometer (sold separately)
To set speeds at a location away from the driver, connect an accessory external speed potentiometer as shown below.

Note:
● The speed in the graph represents the speed of a motor alone. The gearhead output shaft speed of the combination type is calculated by dividing the graph speed by the gear ratio.

④ Set speeds using external DC voltage

Set the external voltage select switch on the driver in accordance with the external DC voltage to be supplied. Detach the digital operator and set the switch to either 5 V or 10 V.

Thereafter, connect an external DC power supply as shown below. Connect the positive and negative terminals of the power supply correctly.

External DC Voltage – Speed Characteristics (Representative values)

Note:

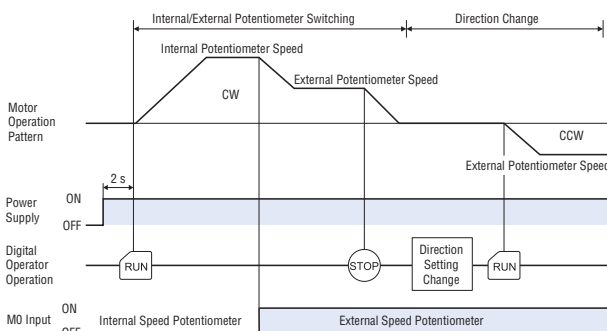

- The speed in the graph represents the speed of a motor alone. The gearhead output shaft speed of the combination type is calculated by dividing the graph speed by the gear ratio.

● Multi-Speed Operation

◇ Two-Speed Operation

The speed set by the internal speed potentiometer and another set by an external speed potentiometer can be combined for two-speed operation by switching the operation-data selection input M0.

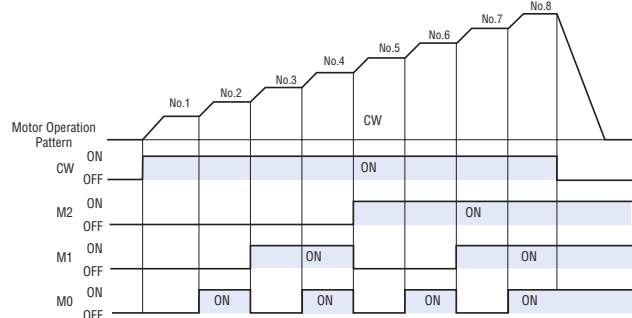

M0 Input	M1 Input	M2 Input	Speed Setting Method
OFF	OFF	OFF	Internal speed potentiometer
ON	OFF	OFF	External speed potentiometer

◇ Eight-Speed Operation

A multi-speed operation using up to eight speeds can be performed by setting desired speeds in operation data No. 1 to 8 and then switching the speed using operation-data selection input M0, M1 or M2.

Operation Data	M0 Input	M1 Input	M2 Input	Speed Setting Method
No. 1	OFF	OFF	OFF	Internal speed potentiometer/Digital operator
No. 2	ON	OFF	OFF	External speed potentiometer/Digital operator
No. 3	OFF	ON	OFF	Digital operator
No. 4	ON	ON	OFF	Digital operator
No. 5	OFF	OFF	ON	Digital operator
No. 6	ON	OFF	ON	Digital operator
No. 7	OFF	ON	ON	Digital operator
No. 8	ON	ON	ON	Digital operator

● Multi-Motor Control

Two or more motors can be operated at the same speed using a single external speed potentiometer or external DC voltage. The diagram below applies to a single-phase power supply specification. Also note that the diagram does not show the motor or operation control part.

◇ Using an External Speed Potentiometer (Sold separately)

As shown in the diagram, use a common power supply line and a common speed control line for each driver and set speeds using the external speed potentiometer VRx.

The resistance of the external speed potentiometer is determined using the formula below:

Resistance when n numbers of drivers are connected:

$$VRx = 20/n \text{ (k}\Omega\text{)}, n/4 \text{ (W)}$$

Example: When two drivers are connected

$$VRx = 20/2 = 10 \text{ (k}\Omega\text{)}, 2/4 = 1/2 \text{ (W)}$$

Accordingly, the resistance is calculated as 10 kΩ, 1/2 W.

To adjust the speed difference between motors, connect a 1.5 kΩ, 1/4 W resistor to the VM terminal on the first driver, and connect a 5 kΩ, 1/4 W variable resistor (VRn) to the VM terminal on each of the remaining drivers.

Up to five drivers can be operated in parallel using an external speed potentiometer.

◇ Using External DC Voltage

As shown in the diagram, use a common power supply line and a common speed control line for each driver and connect all drivers to a 5 V or 10 V DC power supply.

The power-supply capacity of the external DC power supply is determined using the formula below:

Power-supply capacity when n numbers of drivers are connected:

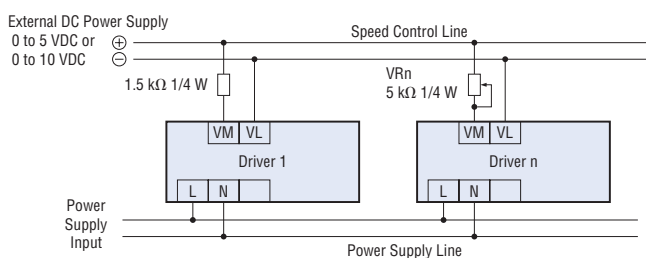

$$I = 1 \times n \text{ (mA)}$$

Example: When two drivers are connected

$$I = 1 \times 2 = 2 \text{ (mA)}$$

Accordingly, the power-supply capacity is calculated as 2 mA or more.

To adjust the speed difference between motors, connect a 1.5 k Ω , 1/4 W resistor to the VM terminal on the first driver, and connect a 5 k Ω , 1/4 W variable resistor (VRn) to the VM terminal on each of the remaining drivers.

◇ Using the Digital Operator

When multiple drivers are connected where the same data are set digitally in each driver, the operations of multiple motors can be controlled via an external input signals using the wiring circuit shown below.

Rotation Direction of the Hollow Shaft Flat Gearhead

The hollow shaft flat gearhead of the combination type rotates in the direction as shown below, with respect to the direction input from the driver.

Accessories (Sold separately)

Remote-Control Kit (RoHS)

The remote-control kit is useful if you want to detach the digital operator from the driver and install it on the frame of the equipment, etc., for remote operation.

The kit includes an extension cable for digital operator/driver connection (2 or 5 m) and a rubber gasket.

Model	Length: L (m)
BLFHS-02	2
BLFHS-05	5

Example of Use
